“K-RAS testing should be routinely conducted in all colorectal cancer patients immediately after diagnosis to ensure the best treatment strategies for the individual Patient”

- Dr. Eric Van Cutsem, presenter at the June 2008 American Society of Clinical Oncology meeting  
FDA recommends genetic screening prior to treatment with Abacavir

ROCKVILLE, Md -- July 24, 2008 -- The US Food and Drug Administration (FDA) has issued an alert regarding serious, and sometimes fatal, hypersensitivity reactions (HSRs) caused by abacavir (Ziagen) therapy in patients with a particular human leukocyte antigen (HLA) allele, HLA-B\* 5701.

Genetic tests for HLA-B\*5701 are already available, and all patients should be screened for the HLA-B\*5701 allele before starting or restarting treatment with abacavir or abacavir-containing medications.

“FDA has approved the expanded use of Selzentry... to include adult patients with CCR5-tropic HIV-1 virus who are starting treatment for the first time.”

The charges included \$4.0 million in severance and other personnel costs along with \$9.8 million in facility-related costs associated with the integration of Genzyme Genetics. The charges also included a \$14.8 million write-off of an investment made in a prior year. The after tax impact of these charges decreased net earnings for the quarter ended March 31, 2011, by \$16.9 million and diluted earnings per share by \$0.16 (\$16.9 million divided by 103.2 million shares).

2) During the first quarter of 2010, the Company recorded net charges of \$9.3 million relating to severance payments and the closing of redundant and underutilized facilities as well as the write-off of development costs incurred on systems abandoned during the quarter.
